

A multi-LLM, tools-capable autonomous agent · invocation-driven 9-phase cycle · SQLite/KFM source of truth · closed drift-trust-escalation feedback · v4.120

Self-steering = FLUSH scores composite drift + trust readiness each cycle; escalation memory promotes a failed task one tier next attempt — a closed feedback loop back into the scheduler.

Chimera proposes, operator disposes = every mutation, self-PR and foreign-PR is a trust-gated, fail-closed DRAFT; ARCHIVED→KILLED and PR merges are operator-gated.

Repo: [elementalcollision/chimera](#) · endpoint **chimera** = **chimera.cli:main** · one 9-phase cycle per **chimera run** (live loop in `chimera/core/loop.py`) · 439 files · 188 ADRs.

Grounded in a 12-agent CodeGraph map of the repo. Boxes name the primary module + real symbols; facts cite thresholds, env flags (`CHIMERA_*`) and ADR numbers. Derived recall (Kuzu / FTSS) is rebuildable; SQLite + mind/ are canonical.
